/note="Organ: lung; Vector: pT713D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from pooled lung tumor tissue, and was then primed with a Not I -oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. Library went through one round of normalization. Library constructed by Bento Soares and M. Fatima Bonaldo.

                                                                                                                                                                                                                                                                                                                                                                          The sel-12 gene (AAT60106) of Caenorhabditis elegans (CE) encodes a polypeptide (AAM14006) that displays about 50% amino acid sequence defentity to human presentiin PS1 and PS2 proteins associated with Alzheimer's disease (AD). Like presentiins, sel-12 is widely expressed in neural and non-neural cells. The gene was identified by Streening for suppressors of the 'Multivulva' phenotype of CE caused by an allele of lin-12 that causes constitutive LiN-12 cativation. 2 Recessive suppressors, ar131 and ar133, proved to be alleles of the new gene (sel means suppressor and/or enhancer of lin-12). The gene can be used to produce wild-type or mutated (see lin-12). The gene can be used to produce wild-type or mutated (see also AMM14007) SEL-12 in host cells, in methods for screening for extragenic suppressors or enhancers of a SEL-12 allele, and in the development of transgenic annimals, esp. transgenic CE, useful in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1140 TGTGGAAGAAGCGGAGCTGAAATACGGAGCATCTCACGTATTCATCTATTTGTGCCGGT 1199
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to DNA molecules comprising the promoter of the sel-12 gene from Caenorhabditis elegans operably linked to a heterologous DNA sequence encoding a protein of interest. The sequence can be used to develop drugs for the treatment, prevention or delay of a neuronal disorder. In particular, the neuronal disorder may be familial Alzheimer's disease. The present sequence is the C. elegans sel-12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               37

The present sequence represents the human S182 gene, FS1 locus. Mutant PS1 produces a gene product that increases the probability of Alzahamer's disease. Possible mutations of the PS1 locus are shown in the features table. A nucleic acid sequence able to hybridise to sequences coding for a mutant PS1 polypeptide can be used as probes for diagnosing an increased likelihood of contracting Alzhahamer's disease. Alzhodimer sequences containing or expressing a nucleic acid molecule, protein or antibody specific for mutant PS1 can be administered to a protein to rantbody specific for mutant PS1 can be administered to a prient to reduce the likelihood, or delay the onset, of Alzheimer's disease, e.g. anti-sense RNA expression can be used to decrease alzheimer's disease protein can be used to decrease chrements disease protein can be used to test candidate therapeutics and to investigate the normal role of PS1. The PS1 peptide may also be included in pharmaceutical compositions (vaccines) for Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chromosome 14 early-onset familial Alzheimer's disease gene PS1 mutants - useful for diagnosing likelihood of developing Alzheimer's disease, also anti-sense sequences, antibodies and vaccines to delay

Cells transformed with the DNA are used to produce recombinant (II) and analogues, useful e.g. as immunogens for generating an immune response against PSI/429. (II) is a new product of the PSI gene, mutations in which cause Alzheimer's disease (AD). The nucleic acids are

```

```
generally useful as probes for detection and quantification of PS1/429, particularly for diagnosis of AD, especially the target sequences that hybridise with probes are isolated for sequencing. Antibodies (Ab) can also be diagnosed at the protein level using Ab as immunoassay reagents. Ab can also be used to identify epitopes and for affinity purification of peptides. Antisense nucleic acid may also be used to regulate expression of the PS1/429 gene, and both nucleic acids and peptides are useful as size markers in electrophoresis, chromatography etc. The transgenic animals are used as models for AD, e.g. for testing druges. Regulators of the PS1/429 gene or polypeptide can be used to treat e.g. AD or diseases involving mitochondrial pathology, apoptosis and neurodegeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           232 ThrProLysGlyProLeuArgTyrLeuValGluThrAlaGlnGluArgAsnGluProlle 251

This sequence encodes the PS1/467 presentlin peptide. This sequence is specifically stated as not being in the nucleic acid of the invention, which encodes the PS1/429 presentlin peptide PS1/429 (II). Cells transformed with the DNA are used to produce recombinant (II) and analogues, useful e.g. as immunogens for generating an immune response against PS1/429. (II) is a mew product of the PS1 gene, mutations in which cause Alzheimer's disease (AD). The nucleic acids are generally useful as probes for detection and quantification of PS1/429, and probes are isolated for sequencing. Antibodies (Ab) can by bridise with probes are isolated for sequencing. Antibodies (Ab) can also be used to identify epitopes and for affinity purification of peptides. Antisense nucleic acid may also be used to regulate expression of the PS1/429 gene, and both nucleic acids and peptides are useful as size markers in electrophoresis, chromatography etc. The transgenic chimals are used as models for AD, e.g. for testing drugs. Regulators of the PS1/429 gene or polypeptide can be used to treat e.g. AD or diseases involving mitochondrial pathology, apoptosis and neurodegeneration.

Typical regulators are antisense sequences, ribozymes, aptemers, syntheric or natural compounds. (II) may also be used to target other coding sequences to particular cellular locations.
                                                                                                                                                                                                                   DNA encoding presenilin peptide PS1/429 and its analogues - useful for diagnosis and treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2764 BP; 715 A; 624 C; 653 G; 772 T; 0 other;

```

The present invention relates to DNA molecules comprising the promoter of the sel-12 gene from Caenorhabditis elegans operably linked to a heterologous DNA sequence encoding a protein of interest. The sequence and be used to develop drugs for the treatment, prevention or delay of a neuronal disorder. In particular, the neuronal disorder may be familial Alzheimer's disease. The present sequence is a presentin coding sequence described in the exemplification of the invention. Claim 2; Fig 4; 78pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAT40028 and AAT40029 represent the coding sequences for the two different forms of wild type human presentlin-1 [PS-1]. The form represented by AAT40029 results from alternate splicing of the genomic DNA sequence. AAT40031 represents the coding sequence for wild type human PS-2. The presentlins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in these sequences can be used for diagnosis of these diseases. The encoded proteins, or vectors that express them or containing antisense sequences, antibodies selective for mutant forms of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the encoded proteins (such as AAN05736) and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for durg screening. The antibodies can also be used e.g. for affinity purification and in immunoassays. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New presention genes - useful for diagnosis, therapy and drug screening of familial Alzheimer's disease, cerebral disorders, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 2765 BP; 715 A; 624 C; 652 G; 773 T; 1 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for identifying modulators of presentlin and catenin p120. Modulators of catenin p120 and presentlin are useful for the treatment and prophylaxis of disorders that is responsive to modulation of presentlin/catenin p120 activity. In particular, neuronal disorders such as cognitive disorders and neurodegenerative diseases such as Albeimer's disease. Catenin p120 bNAs are useful for identifying mutations in catenin p120 genes. Indentification of such mutations assist in the diagnosis of or succeptibility to Albeimer's or other conditions associated with presentlin and in assessing the physiology of such disorders. Catenin p120 bNAs are also used in hybridisation studies to monitor expression of p120 genes and in particular for up or down regulation of catenin p120 expression. The present DNA sequence encodes human presentlin-1 (PS-1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         438 GAGCAAGATGAGGAAGAAGATGAGGAGCTGACATTGAAATATGGCGCCCAAGCATGTGATC 497

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a modulator of presentlin function by determining the ability of presentlin to bind to a KIAA0253 polypeptide in the presence and absence of a test compound, useful in the treatment or prophylaxis of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes human presentlin 1. KIAA0253 binds to presentlin. The specification describes a method of identifying a modulator of presentlin function or KIAA0253 function. The method comprises determining presentlin activity or KIAA0253 activity in the presence and absence of a test compound, where presentlin activity is determined by its ability to bind to KIAA0253. A modulator of presentlin or KIAA0253 polypeptide is useful in the manufacture of a medicament for the treatment or prophylaxis of Alzheimer's disease. The KIAA0253 polymucleotide and KIAA0253 polypeptide are useful in the treatment, prophylaxis or diagnosis of Alzheimer's disease.

Another full-length cDNA (AATS9535) of the EOAD gene codes for a 467-amino acid polypeptide (AAM1840). The 2 sequences can be used to generate primers and probes for the diagnosis of predisposition to Alzheimer's disease, esp. EOAD.
                                                                                                                                                                                                                                                                                                                                                                          Human early onset Alzheimer's disease (EOAD) splice variant gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 272 GluAsnThrThrAspProArgGluProThrSerSerAspSerAsnThrSerThrAlaPhe 291
                                       A full-length cDNA (AAT59535) of the early onset Alzheimer's disease (BOAD) gene sequence codes for a 467-amino acid polypeptide (AAW11839). Another full-length cDNA (AAT59516) of an BOAD splice variant gene codes for a 463-amino acid polypeptide (AAW11840). The 2 sequences can be used to generate primers and probes for the diagnosis of predisposition to Alzheimer's disease, esp. BOAD. They can also be used for prodn. of BOAD polypeptides in transformed host cells, and antisense sequences can be used for the treatment of BOAD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GlnGluAspGluAsnValValGluGluAlaGluLeuLysTyrGlyAlaSerHisValIle

The invention relates to detecting (M1) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA dity analysis as given in the specification, and comparing the expression level in an unactivated the expression level in an unactivated comparing the expression level in an unactivated (GCA). Also included are modulating (M2) GA by contexting GCA with an agent that alters the expression of at least one gene in GS; (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject; exposure of a subject to a pathogen or sterile inflammatory disease using the cubject to a pathogen or sterile inflammatory disease, by detecting the cubject to a pathogen or sterile inflammatory disease, by detecting the cubject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene (8) from GS, where complete the expression of the gene is indicative of inflammation; (4) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response in a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene (8) from GS in the tissue. M1 is useful for detecting a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatory distress syndrom; unjury, ARDS, adult respiratory distress syndrom; or inflammatory bowel disease, crohic disease, ulcerative colitis, periodottal disease, also bacterial infection, viral infection, and M5 is
Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ftp.wipo.int/pub/published_pct_sequences.

different forms of wild type human presentlin-1 (PS-1). The form
celliferent forms of wild type human presentlin-1 (PS-1). The form
represented by this sequence results from alternate splicing of the
genomic DNA. AAT40031 represents the coding sequence for wild type human
PS-2. The presentlins are a family of highly conserved integral membrane
proteins with a common mutational hot spot regions. Mutations in PS genes
are implicated in familial Alzheimer's disease (AD) and possibly other
diseases such as cerebral haemorrhage, schizophrenia, depression etc., so
detection of mutations in these sequences can be used for diagnosis of
these diseases. The encoded proteins, or vectors that express them or
containing antisense sequences, antibodies selective for mutant forms of
the encoded proteins (such as AAW05736) and modulators of PS gene
containing are useful as models for drug screening. The antibodies can also
be used e.g. for affinity purification and in immunoassays.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
